

## **MASK WITH PATTERNED LIGHTING**

### **Abstract of the Disclosure**

A device is provided for covering the wearer's face and eyes having a first masking layer which is adapted to cover at least a portion of the face of the wearer. The first layer generally conforms to the topography of the human face and has openings for the eyes of the wearer so that the wearer can see therethrough. A second masking layer is provided in a closely spaced relationship with the first masking layer. The second layer has eye openings in substantial registration with those of the first layer. A plurality of lamps are fixedly positioned between the first and second masking layers and electrically connected to a controller for activation of the lamps. The second masking layer is preferably translucent such that the activation of the lamps is visible therethrough.
